1 Deep 3D Learning Notes

1.1 potential solutions for over fitting

- data augmentation: rotation, different size scale
- data regulation: group norm
- dropout
- combine ShapeNet data
- more powerful network to learn more systematic information:
 - 1. use large global block size
 - 2. dynamic sampling

• smaller net

1.2 Important improvements

- Generate bxmh5 online. So the randomly missing part in each epoch is different. This maybe solve the info missing problem for sparse voxel 3d cnn, especially considering that block merging cannot be applied for voxel cnn. However, on line sampling can only solve missing problom of training, test missing still need some tricks to perform block merging.
- Check this: my usage of tf.gather_nd should cost a lot of memory, maybe too much!

1.3 Theory

1.3.1 bidxmap

1.3.2 group sampling configuration

$$steps = [0.1, 0.3, 0.9, 2.7] + [-6.3]$$

 $strides = [0.1, 0.2, 0.6, 1.8] + [-3.6]$
 $voxel\ size = [, 3, 4, 4, 3]$

principles:

(1) Alignment between different scales:

$$steps[i] = steps[i-1] + strides[i-1] * (k-1) (k = voxel \ size)$$

(2) Alignment between voxels on one scale:

$$strides[i]\%steps[i-1] == 0$$

Examples:

$$0.3 = 0.1 + 0.1 * 2 \Rightarrow voxel \; size = 3$$

$$0.2 = 0.1 * 2$$

$$0.9 = 0.3 + 0.2 * 3 \Rightarrow voxel \; size = 4$$

$$0.6 = 0.3 * 2$$

$$6.3 = 2.7 + 1.8 * 2$$
$$3.6 = 1.8 * 2$$

1.3.3 Sparse voxel 3DCNN

1.3.4 Data Augmentation

- (1.1) Rotate corrdinate reference: Rotate both point and voxel box Performed by rotating points after sampling and grouping. This should only be applied to point position (cascade 0). What if also to features (upper cascades).
- (1.2) Rotae point only, or rotate voxel box only.
 - a) It can be performed by rotating points before sampling and grouping.
 - b) If rotate angle is integral times of pi/2, it can be performed by rotating point indices inside the voxel.

Rotate voxel can be applied to all cascades.

- (2.1) Rotate the global block by the same angle
- (2.2) Rotate each voxel by seperate angle in each scale.

Since the features are calculated independently in each voxel, it should be fine to apply different rotatio angle for each voxel. It doesn't matter that the rotation center is voxel center or global block center. It alos doesn't matter that it rotates refference or only rotates voxel.

Sparse voxel 3D CNN

Two main obstacles for performing 3D convolution on point cloud are: (1) there are too many vacant points, (2) the position of points are not aligned. The key idea of sparse voxel is to perform 3DCONV on cascades from the second. Because the positions are actually almost aligned. At the same time, the vacant rate within a small block is acceptably large. Above all, it may be possible to do apply 3D-CONV within a small block.

Centres of blocks in cascades other than first one are actually aligned to the grid. So it is possible to perform 3d convolution directly. However, the average position of points inside these blocks are not aligned. Thus it is also maybe beneficial to utilise a transform net to align them.

On the other hand, there are many vacant points in the block. I am wondering if it is beneficial to set the features of vacant points by a T-net from around existing points.

Purpose of T-Net: fix number + align + till

There are some interesting problems for Transform net:

- Only depend on position or feature.
- Should be resolution invariant.
- If it should be constant for all channels.
- If it should be constant for all local aim blocks.

Reasons that we do not need the T-Net:

- 3d-conv can till features of the vacant points.
- If the base-points are not strictly aligned, add the position to feature map. Or get a special feature of positions within the block and then add of the main feature map.

Transform net:

$$(b, n, g_m, 3)$$

$$(b, n, g_m, c_1)$$

$$(b, n, g_m, c_2)$$

$$/$$
 (b, n, g_m, g_i) $/$

1.4 batch size

1.4.1 bs=27 vs bs=81

batch size: 9,27,81

data: xyz-color_1norm

model: 1AG

sampling & grouping: stride_0d1_step_0d1_bmap_nh5_2048_0d5_1_fmn1-160_32-160_0d1_step_0d1_st

 $32_12\text{-}0d2_0d6\text{-}0d2_0d6$

Figure 1: bs=9

Figure 2: bs=27

1.5 feed elements

 $\begin{array}{l} {\rm epoch~num} = 100 \\ {\rm stride_0d1_step_0d1_bmap_nh5_2048_0d5_1_fmn1-160_32-32_12-0d2_0d6-0d2_0d6} \end{array}$

Figure 3: bs=81

model	batch size	data elements	acc	loss
1AG	9	xyz color	0.890	0.356
1AG	27	xyz color	0.920	0.240
3AG	27	xyz color	0.912	0.273
2A	27	xyz color	0.908	0.294
2AG	27	xyz color	0.902	0.293
1A	27	xyz color	0.883	0.351
1AG	81	xyz color	0.978	0.072
1AG	9	xyz	0.861	0.427
1AG	27	xyz	0.907	0.257
1AG	81	xyz	0.975	0.078
1A	27	xyzmid color	0.889	0.357
3AG	27	xyzmid color	0.933	0.193
2A	27	xyzmid color	0.939	0.177
2AG	27	xyzmid color	0.929	0.208
3AG	27	xyz xyzmid color	0.924	0.230
2A	27	xyz xyzmid color	0.898	0.317
2AG	27	xyz xyzmid color	0.908	0.280
1A	27	xyz xyzmid color	0.910	0.281
1AG	27	xyz xyzmid color	0.944	0.163
1AG	81	xyz xyzmid color	0.976	0.078
2A	81	xyz xyzmid color	0.942	0.173
3AG	81	xyz xyzmid color	0.949	0.147

- 1. large batch size is better
- 2. 1AG(0.92) > 3AG(0.912) > 2A(0.908) > 2AG(0.902) > 1A(883)

1AG is much better than 1A

1AG is a bit better than 3AG???

- 3. xyz-color is only a bit better than xyz
- 4. xyzmid-color is much better than xyz-color
- $5.\,$ xyzmid-color is normally much better than xyz-xyzmid-color ???

Conclusion:

- (1) 3aG is much better than 4bG. Potential reasons:(a) 4bG is too wide and deep, so that needs more time to train. (b) The batch size of 4bG is too small
- (2) nein 144 seems is not better than 111
- (3)Learning rate 0.002 is better than 0.007
- (4)Loss weight CN does not help

-					I.	

Conclusion:

Mid norm in sub block seems worse than no.

The infuence of input drop seems not obvious.

Dropout of cnn (0.5) makes the net really hard to train. Seems no good for overfitting.

Group norm is poor.
